

## At a Glance

- **Boosts spam filtering for added protection**
- **Recurrent Pattern Detection** detects and blocks spam within moments of the outbreak
- **Effective against all types of spam**, regardless of:
  - Location
  - Format
  - Content
  - Language
- **Filters SMTP, POP, and IMAP**
- **Per user quarantine** for easy administration
- **Personal pass lists** so users can decide what is and is not spam
- **Reports** let you monitor the spam on your network down to the user and message

*"Right away, spam was down ninety-five percent."*

## Overview

For users who are extremely sensitive to spam or in environments where spam is an issue, the **TotalCareUntangle™ Commtouch Spam Booster** takes filtering to a whole new level. It works by matching your inbound messages against Commtouch's real-time outbreak analysis, and is proven to improve performance of traditional filtering methods and is especially effective during the first few hours of a spam storm.

**Commtouch Spam Booster** can give you that additional edge in the fast changing game of spam detection. When combined with TotalCareUntangle's already rigorous message analysis using Bayesian filters, Razor, DNSBL/RBLs, optical character recognition (OCR), and PDF scanning, you get a jump start on spam detection, dead-on accuracy, and nearly zero false positives.

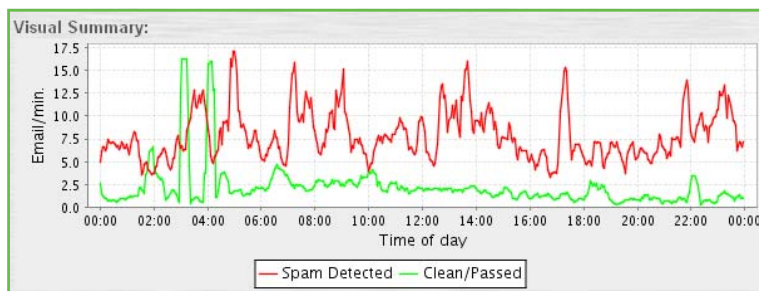

*The TotalCareUntangle™ Commtouch Detection Center identifies spam outbreaks as they occur allowing real-time classification of inbound emails*

## Detects and Blocks Spam within Moments of an Outbreak

Rather than evaluating the content of messages, the Commtouch Detection Center performs real-time analysis on over three billion messages a month to identify distribution patterns at the start of each outbreak. Also known as Recurrent Pattern Detection (RPD), the technique is equally effective against all types of spam in any location, format, content, or language. With RPD, you no longer have to trade-off accuracy with effectiveness.

## Easy to Administer

Untangle supports filtering for SMTP, POP and IMAP with adjustable scan strengths by protocol. Once set-up there is little to no ongoing administration necessary because each user manages his or her own quarantine and pass list, while reports give you a comprehensive view of the spam environment on your network, including the source of the spam and how much spam is received in aggregate and by user.

*Summary and Detail Reports let you monitor network spam*
